TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript (ES6+), SQL

AI Engineering: LLM APIs (Anthropic Claude, OpenAI, Gemini, Groq), RAG pipelines, vector search (pgvector, MongoDB Atlas), embeddings, AI agents, prompt engineering, LangChain, BYOK

Backend: FastAPI, Node.js, Express.js, Next.js, React.js, RESTful API Design, WebSockets, Microservices

Cloud & DevOps: AWS (SQS), Docker, Linux, GitHub Actions, CI/CD, Trigger.dev, Vercel, New Relic APM

Data & Security: PostgreSQL (RLS), MongoDB, Redis, Drizzle ORM, OAuth 2.0, JWT, RBAC, HMAC-SHA256 webhooks, AES-256-GCM

PROFESSIONAL EXPERIENCE

Full Stack Developer

Aug 2024 – Present

Glitchover (Diasimos Private Limited) | B2C Gaming Platform

Onsite, Ahmedabad

- Architected a cost-first **3-provider LLM fallback chain** (Gemini → Cerebras → Groq) behind a real-time AI support bot — quota-aware provider skipping, per-provider JSON-repair retries, and graceful human-agent handoff when every provider is exhausted.
- Built a **vector search RAG pipeline** on MongoDB Atlas (`$vectorSearch`) with 1,024-d L2-normalized embeddings behind a **0.55 confidence gate** — low-confidence queries auto-escalate to human agents, grounding every response and eliminating hallucinated support answers.
- Resolved critical race conditions in payment confirmation by applying atomic transactions and idempotent webhook handling across **3 payment providers** (Razorpay, Stripe, Cashfree) — eliminated financial inconsistencies under concurrent load.
- Integrated **3 third-party payment gateway APIs** through Strategy Pattern adapters — an abstract contract for `createOrder()`, `verifyPayment()`, and `terminateOrder()` with runtime gateway selection and zero controller-level branching.
- Introduced a Redis caching layer over high-read endpoints, reducing database load at peak and improving **p99 response times**; instrumented payment flows with **New Relic APM** for sub-minute incident detection.
- Built GitHub Actions CI/CD pipelines cutting deployment time by **70%**; authored Jest unit and integration suites that measurably reduced production regressions, shipped within Agile sprints with regular code review.

PROJECTS

Genora – Multi-Platform AI Content Engine

Next.js, TypeScript, Python, FastAPI, PostgreSQL, pgvector, Trigger.dev, Upstash Redis

- Built a **Writer → Critic → Reviser** AI agent loop in Python/FastAPI directly on provider SDKs without LangChain — each draft is critiqued and revised against platform-native constraints before persistence, keeping control flow explicit and debuggable.
- Grounded generation in a **pgvector** RAG retrieval layer over each user's prior writing — Gemini embeddings truncated to **768 dimensions**, with vector queries scoped per user so no cross-tenant context can enter a prompt.
- Implemented bring-your-own-key (BYOK) API key support across **4 LLM providers** (Anthropic, OpenAI, Gemini, Groq) with keys encrypted at rest under **AES-256-GCM** — provider errors reclassified 4xx vs. 5xx and auth failures redacted before reaching the client.

Deplyx – AI Model Deprecation Monitor

Next.js, React, TypeScript, PostgreSQL (RLS), Drizzle ORM, Auth.js, Octokit, Turborepo

- Integrated GitHub through **2 separate identities** — an OAuth 2.0 App for user login via Auth.js v5 and a GitHub App for repository installation and webhook ingestion — with signature-verified webhooks and installation tokens minted on demand, never persisted.
- Enforced multi-tenant isolation in PostgreSQL with **FORCE ROW LEVEL SECURITY** and fail-closed policies — an unscoped connection matches zero rows rather than erroring or leaking, with the tenant key carried on every table.

EDUCATION

L. J. Institute of Engineering and Technology

Ahmedabad, India

Bachelor of Engineering in Computer Science and Engineering | CGPA: 8.48/10.0

Nov 2021 – July 2025
